

# Gonioscopy

David M. Cale, OD, FAAO

# Disclaimer

---

- ▶ This lecture has been independently developed by the lecturer.
- ▶ Dr. Cale has no financial relationship or conflict of interest with any referenced authors, studies, or business related to topics discussed in this lecture

# Learning Objectives

---

- ▶ At the end of the lecture the attendee will be able to:
- ▶ List indications for performing gonioscopy
- ▶ Recognize good gonioscopy technique
- ▶ Interpret & document observed angles
- ▶ Recognize normal & abnormal angle architecture & implications

# Anatomy:

Where is the canal of Schlemm?

- ▶ **Schwalbe's line (SL)**
  - ▶ Sampaolesi line
- ▶ **TM**
  - ▶ anterior
  - ▶ posterior
- ▶ **Scleral spur (SS)**
- ▶ **Ciliary body (CB)**
  - ▶ wider in myopes
- ▶ **Iris root**
- ▶ **Widest inferior**

# When to perform gonioscopy (92020)

---

- ▶ Narrow angle (365.02) or suspected obstruction of TM per Van Herick estimate
- ▶ Shallow A/C (penlight shadow test)
- ▶ Evidence of prior angle closure
- ▶ POAG or secondary glaucoma or suspect
- ▶ History of ocular contusion (**NOT acute injury**)
  - ▶ R/O angle recession, iridodialysis, cyclodialysis
- ▶ Risk of NVA (e.g. ischemic CRVO, BRVO)

# Penlight shadow test

W Alward  
*Color Atlas of  
Gonioscopy*  
1994

# Is your view all the way in?

---

The iris beam  
meets the  
anterior wall  
beam where the  
iris root inserts  
OR where there  
is apposition

A gap separating  
these 2 beams  
indicates there is  
open space  
beyond your view

# Corneal wedge/ Focal line

---

# Gonioscopic Variations

# Gonioscopic Variations

Narrow CB,  
wide SS,  
pigmented post  
TM

Clear  
posteriorTM with  
pigmented  
anteriorTM

Convex, no  
CB/SS, 'banded'  
TM, Sampaolesi  
line

# Gonioscopy Technique – Dark Room Conditions

---

- ▶ Minimize the impact of room light or slit lamp beam on constricting the pupil
  - ▶ It is estimated (Barkana, et al) that 38% of closed angles may be misdiagnosed by the light opening an appositionally closed angle
    - ▶ This is supported by evidence viewed with ultrasound biomicroscopy examination under dark and light conditions on closed angles

# Angle Variation with Light (UBM)

---

Lights ON

Lights OFF

Friedman, He *Survey of Ophthalmology* Vol53, No3 2008; reprinted from  
Radhakrishnan et al *Arch of Ophth*

---

# Missing the diagnosis of angle closure

---

- ▶ Not performing gonioscopy
- ▶ Not performing gonioscopy under “dark” conditions
- ▶ Increasing IOP/opening the angle using gonio lens
- ▶ Misinterpretation of a Sampaolesi line as pigmented TM

Paul Palmberg, *Gonioscopy in the Laser*  
Age 2003

---

# How we view the angle

---

# Positioning the lens for best view

---

Look “over  
the hill”  
without  
pressing by  
tilting lens  
toward the  
angle being  
viewed

# Indentation or compression

---

- ▶ Applying pressure to the globe by pushing in on the lens (usually more toward one side or edge of lens) can open up the angle and is used to help differentiate appositional closure from synechial closure.
- ▶ This is better accomplished with a 4-mirror (or small faced lens)

# Indenting with 4-mirror

---

Narrow angle,  
convex iris

Indenting with  
gonio lens  
opens view to  
CB

# Ultrasound Biomicroscopy

---

# AS-OCT

---

Friedman, He *Survey of Ophthalmology* Vol53, No3 2008; reprinted  
from Radhakrishnan et al *Arch of Ophth*

# Gonioscopy Lenses

- ▶ Direct (Koepple)
- ▶ Indirect
  - ▶ 3-mirror
  - ▶ 4-mirror
  - ▶ pediatric

# Lens Choice Advantages

---

- ▶ **Goldmann 3-mirror**
  - ▶ Stability
- ▶ **4-mirror**
  - ▶ Quick
    - ▶ May not require interface solution
  - ▶ Compression
  - ▶ Adding flange improves stability

# The Procedure

---

- ▶ Anesthetic
- ▶ Interface Solutions
  - ▶ Goniosol (hydroxypropyl methylcellulose)
  - ▶ Refresh Celluvisc (carboxymethylcellulose)
  - ▶ **RGP conditioning solution**

# Classification

---

- ▶ Shaffer (widely used)
- ▶ Spaeth
- ▶ Scheie (rarely used)
- ▶ Van Herick (non-gonio estimate)

# van Herick

---

- ▶ van Herick : compare a/c depth (endothelium to iris depth) at limbus to corneal thickness in slit lamp optic section
  - ▶ 4 : a/c = cornea
  - ▶ 3 : a/c = 1/4 to 1/2 cornea (and 1/2 to full)
  - ▶ 2 : a/c = 1/4 cornea
  - ▶ 1 : a/c = < 1/4 cornea
  - ▶ slit

# Angle Grades (Shaffer)

---

- ▶ Grade 0 = closed
- ▶ Slit = ( $<10^{\circ}$ ) partial closure
- ▶ Grade 1 = ( $10^{\circ}$ ) closure probable
- ▶ Grade 2 = ( $20^{\circ}$ ) closure possible
- ▶ Grade 3-4 = ( $30-40^{\circ}$ ) wide open
  
- ▶ Correspondance similar to van Herick

# Modified (Shaffer) Diagram Documentation

---

- ▶ Identify most posterior structure seen in each of 4 quadrants
  - ▶ SL, anterior TM, posterior TM, SS, CB
- ▶ Iris approach into angle
- ▶ Iris processes or PAS
- ▶ Pigmentation in TM

# Spaeth grading (e.g. D40r)

## ► site of iris insertion

- A: @ SL
- B: post to SL (@ TM)
- C: @ SS
- D: @ CB
- E: posterior CB

## ► angle width: 10, 20, 30 40°

- configuration: s (steep), r (regular or flat), q (queer or concave)

# Spaeth Grading

6-2 equiv A-E

# Scheie

---

Reversed grading system

---
